

javascript.js

```
// Get the form element
const registrationForm = document.getElementById('registration-form');

// Function to handle form submission
function handleFormSubmit(event) {
  event.preventDefault(); // Prevent the form from submitting

  // Get values from form fields
  const username = document.getElementById('username').value;
  const email = document.getElementById('email').value;
  const password = document.getElementById('password').value;

  // Basic form validation (you can add more validation as needed)
  if (username && email && password) {
    // Display a success message
    alert(`Registration successful!\nUsername: ${username}\nEmail: ${email}`);
  } else {
    // Display an error message
    alert('Please fill in all the required fields.');
```

```
}
```

```
// Add an event listener for form submission
registrationForm.addEventListener('submit', handleFormSubmit);
```
